

Heat foil floor heating for under carpet or parket

The last years we have been able to establish an enormous growth in the placing of wooden floors. The popularity of these floors is to thank for the simplicity of placing these systems, the life-span and the esthetic value of these floors.

One of the very few disadvantages of these floor systems is that the floor stays relatively cold, even when the room temperature is pleasant.

This problem can be easily solved by placing a Heat foil heating system under your floor.

The Heat foil heating system can be used for parket, because the foil only is 0,2 mm thick and very easy to install.

The Heat foil heating system will increase the temperature of your parket with about 6/8 degrees Celsius in comparison with the room temperature. Can you imagine yourself already not having cold feet anymore in the living room, the children's room or bedroom.

The foil is available in different breadths and voltages; 230V and 42V with a transformer that always brings the voltage back to a 42 (safe) voltage.

Often you only have to place foil on 25 till 50% of the total room surface.

The Heat foil heating package 42V contains: the heat foil, transformer, thermostat with floor sensor the system is prewired.

The Heatfoil heating package 230V contains: the heat foil prewired, connector box with Wago clamps and a thermostat.
